

Add Subobject Custom Defined Fields to the Design Pane

To add subobject custom defined fields (CDF) to a data entry form template:

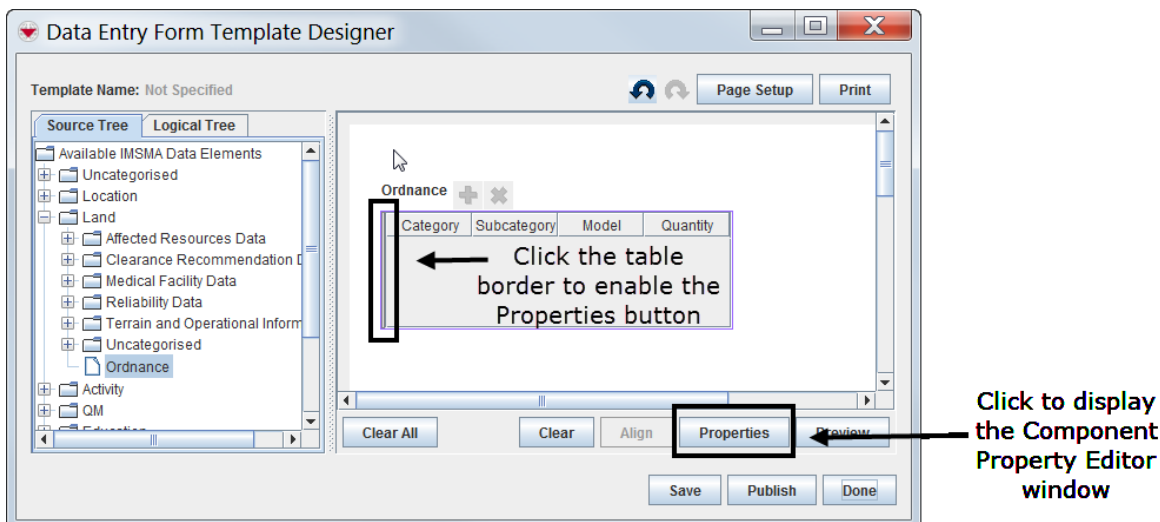

1. In the Data Entry Form Template Designer window, select a subobject table from the data tree and drag it to the design pane.

See Add Custom Defined Fields for examples of subobject tables that you can choose from.

1. Click the left border of the subobject table in the design pane, and then click **Properties** to open the Component Property Editor window.

1. Select subobject CDFs the same way you would select display columns, then click **OK** to close the Component Property Editor window.

You must save and publish the data entry form template in order to display the new subobject CDFs.
